EXECUTIVE SUMMARY

Ethereum USD is presented as a cryptocurrency briefing based on the locally stored historical price record. Over the covered period, the asset delivered a total return of 4.04% and an annualized return of 2.77%, while realized annualized volatility measured 62.56%. Historical downside metrics indicate a maximum drawdown of -62.29% and a one-day 95% historical VaR of 5.57%.

02

HISTORICAL PERFORMANCE

Performance Analysis

LATEST PRICE	TOTAL RETURN	ANNUALIZED RETURN
2,140.88	4.04%	2.77%

PERFORMANCE COMMENTARY

Stored-period performance was positive, with total return of 4.04% and annualized return of 2.77%. The paired exhibits frame both price-path behavior and compounded outcome through time.

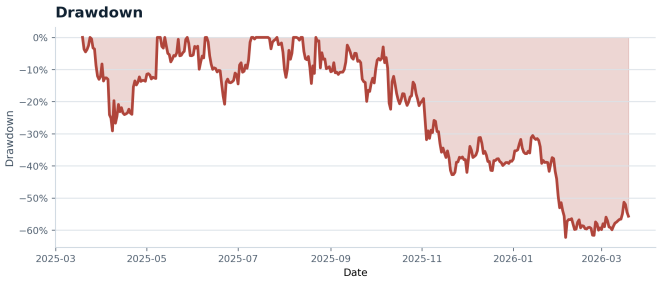
Price history anchors the path review, while cumulative return isolates compounded performance through time. The page is intentionally weighted toward the exhibits rather than long narrative text.

03

HISTORICAL DOWNSIDE REVIEW

Risk Analysis

ANNUALIZED VOLATILITY	MAX DRAWDOWN	HISTORICAL VAR	EXPECTED SHORTFALL
62.56%	-62.29%	5.57%	8.11%



RISK COMMENTARY

Realized annualized volatility was 62.56%, with maximum drawdown reaching -62.29%. Historical one-day downside measures include 95% VaR of 5.57% and Expected Shortfall of 8.11%. These measures are presented as historical downside context, not forward guarantees.

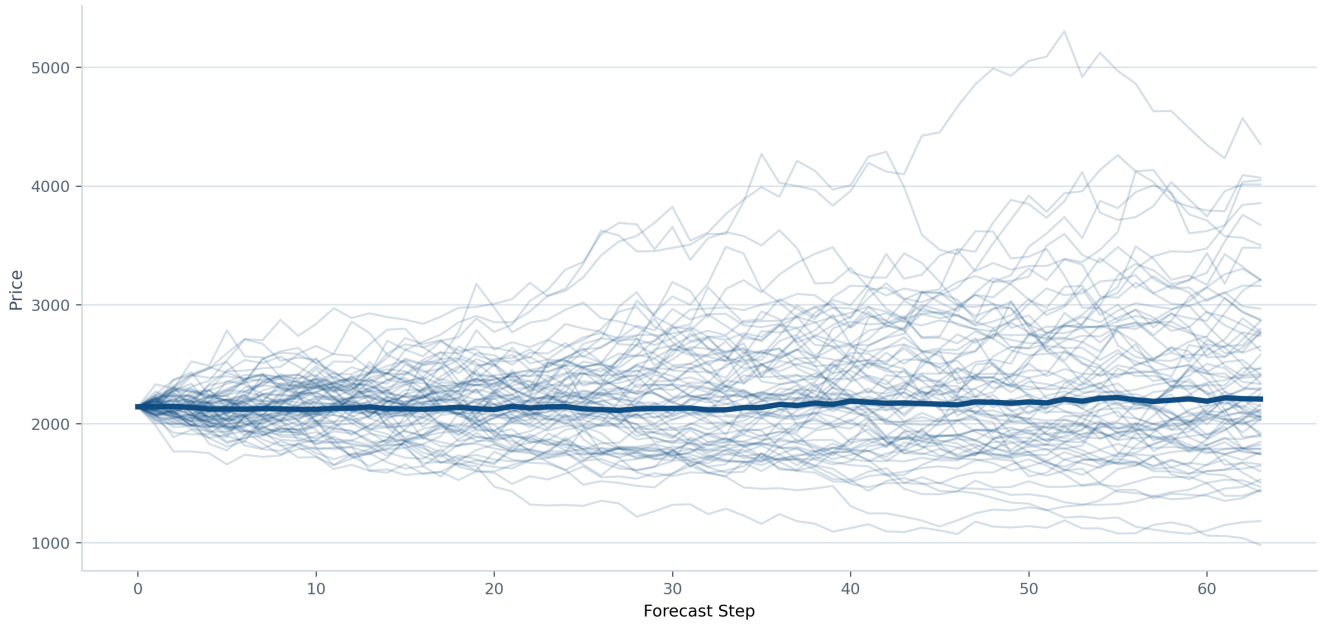
04

FORWARD SCENARIO ANALYSIS

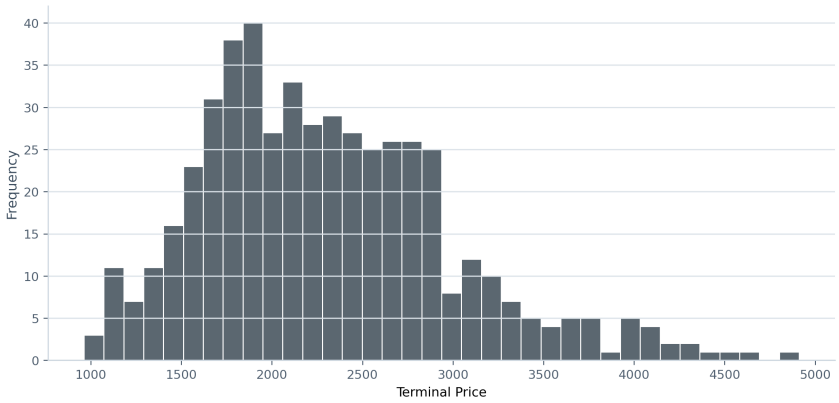
Simulation Outlook

FORECAST HORIZON	SIMULATION COUNT	ESTIMATED DAILY DRIFT	ANN. VOLATILITY
63 trading days	500	0.09%	62.56%

Monte Carlo Price Paths



Terminal Price Distribution



MEDIAN TERMINAL PR	PROBABILITY ABOVE START
2,205.91	55.20%

5TH PERCENTILE	95TH PERCENTILE
1,346.21	3,664.91

TERMINAL PERCENTILE SUMMARY

5TH PERCENTILE	1,346.21
25TH PERCENTILE	1.788.76
MEDIAN	2.205.91
75TH PERCENTILE	2.715.91
95TH PERCENTILE	3,664.91

SCENARIO COMMENTARY

Monte Carlo simulation projects a 63-trading-day forward distribution using historical daily return characteristics as the calibration base. The median simulated terminal price is 2,205.91, with a 5th to 95th percentile range of 1,346.21 to 3,664.91. The output is scenario-oriented and should be read as a range-based planning view.

05

MODEL-INFORMED FORECAST & RISK OUTLOOK

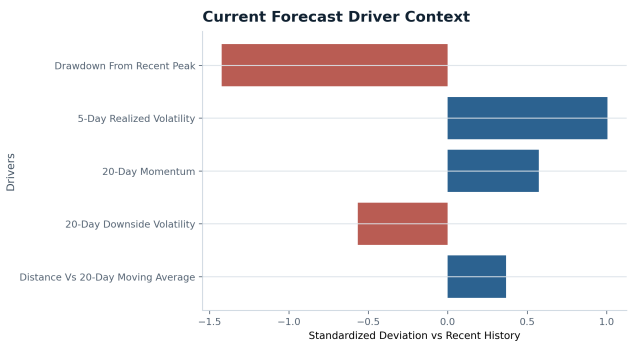
Forecasting Layer

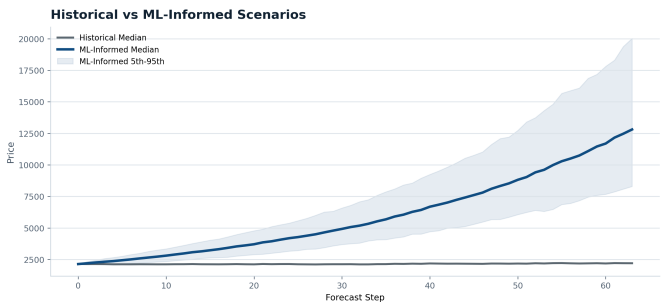
EXPECTED 20-DAY RETURN	PROBABILITY NEGATIVE	VOLATILITY PROXY	REGIME CONTEXT
57.32%	**39.98%**	**55.08%**	**Constructive / Containe**

Prediction history is not yet deep enough to show a stable trend exhibit.

FORECAST INTERPRETATION

The latest model-implied expected 20-day return is 57.32%, while the probability of a negative forward return is 39.98%. Recent realized volatility of 55.08% is used as a practical uncertainty proxy for the ML-informed scenario overlay. Current regime context is summarized as constructive / contained downside risk.





TERMINAL PERCENTILE SUMMARY

5TH PERCENTILE	**8,291.57**
25TH PERCENTILE	**10,648.99**
MEDIAN	**12,807.25**
75TH PERCENTILE	**15,380.77**
95TH PERCENTILE	**20,024.37**

SCENARIO COMPARISON

The historical-input simulation produces a median terminal price of 2,205.91, while the ML-informed scenario produces 12,807.25. The comparison is intended as a decision-support overlay that incorporates the current return and downside-risk forecast into the scenario range rather than replacing historical context.

06 STORED NEWS CONTEXT

Sentiment Review

ARTICLE COUNT	AVG. SENTIMENT	POSITIVE / NEUTRAL	NEGATIVE
1	0.00	0 / 1	0

SENTIMENT COMMENTARY

Recent stored article coverage totals 1 items and implies a mixed news tone, with an average sentiment score of 0.00. Positive, neutral, and negative article counts were 0, 1, and 0 respectively. This section is intended as directional context for the briefing rather than deep NLP inference.

07 DEFINITIONS & NOTES

Methodology

DATA SOURCE NOTES

Historical prices and asset metadata are sourced from the local database, which is populated through the project ingestion layer using yfinance as the initial provider. News sentiment uses stored article records sourced from the sentiment ingestion layer.

METHODOLOGY NOTES

Return metrics use simple daily returns. Volatility is annualized using a 252-trading-day convention. Historical VaR and Expected Shortfall are computed from the empirical daily return distribution.

SIMULATION ASSUMPTIONS

Monte Carlo price paths use a GBM-style process calibrated either from historical daily drift and volatility or from the latest model-implied return/risk overlay. Simulation outputs are scenario-oriented and should not be interpreted as forecasts with certainty.

CAVEATS

The report is intended for analytical review and decision support. It does not constitute investment advice, valuation certainty, or a substitute for independent diligence.
