02 HISTORICAL PERFORMANCE

Performance Analysis

LATEST PRICE	TOTAL RETURN	ANNUALIZED RETURN
249.06	16.22%	16.29%

Price History

PERFORMANCE COMMENTARY

Stored-period performance was positive, with total return of 16.22% and annualized return of 16.29%. The paired exhibits frame both price-path behavior and compounded outcome through time.

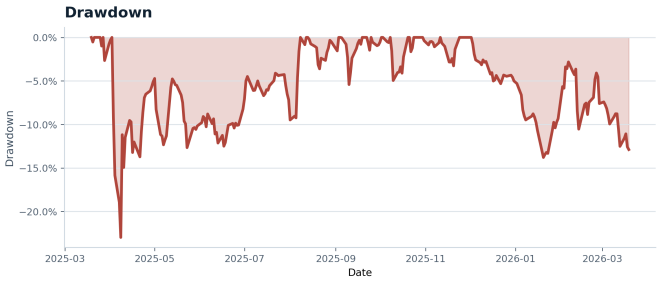
Price history anchors the path review, while cumulative return isolates compounded performance through time. The page is intentionally weighted toward the exhibits rather than long narrative text.

03

HISTORICAL DOWNSIDE REVIEW

Risk Analysis

ANNUALIZED VOLATILITY	MAX DRAWDOWN	HISTORICAL VAR	EXPECTED SHORTFALL
31.76%	**-22.99%**	**3.09%**	**4.50%**



RISK COMMENTARY

Realized annualized volatility was 31.76%, with maximum drawdown reaching -22.99%. Historical one-day downside measures include 95% VaR of 3.09% and Expected Shortfall of 4.50%. These measures are presented as historical downside context, not forward guarantees.

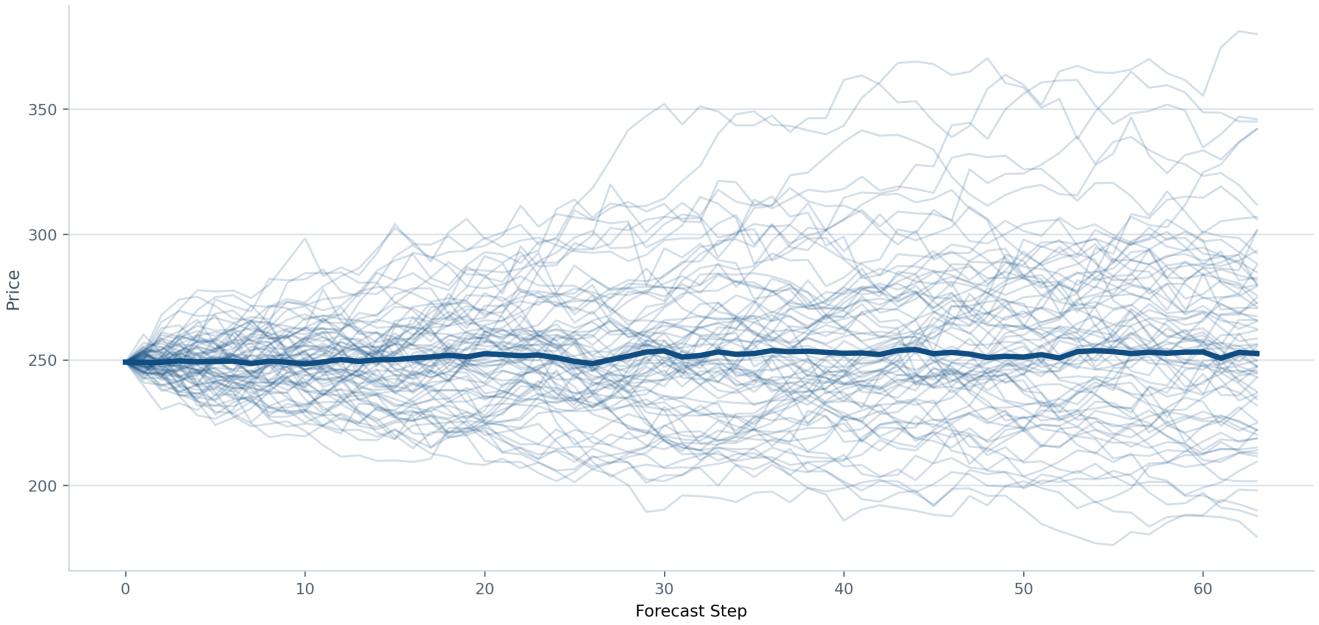
04

FORWARD SCENARIO ANALYSIS

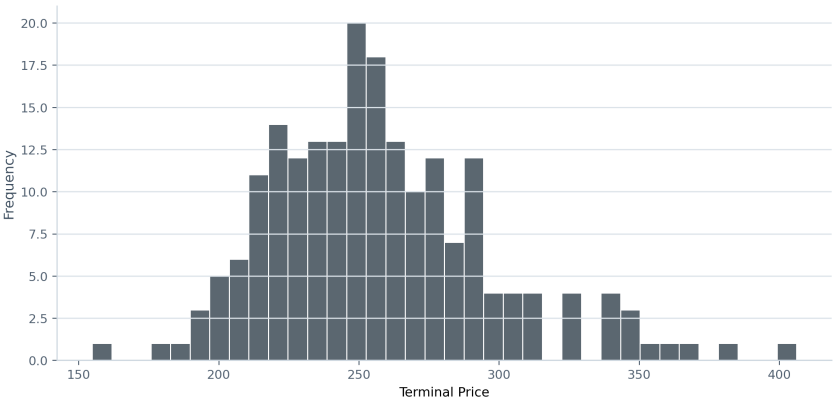
Simulation Outlook

FORECAST HORIZON	SIMULATION COUNT	ESTIMATED DAILY DRIFT	ANN. VOLATILITY
63 trading days	200	0.08%	31.76%

Monte Carlo Price Paths



Terminal Price Distribution



MEDIAN TERMINAL PR	PROBABILITY ABOVE START
252.47	54.50%

5TH PERCENTILE	95TH PERCENTILE
202.26	340.74

TERMINAL PERCENTILE SUMMARY

5TH PERCENTILE	202.26
25TH PERCENTILE	229.85
MEDIAN	252.47
75TH PERCENTILE	279.51
95TH PERCENTILE	340.74

SCENARIO COMMENTARY

Monte Carlo simulation projects a 63-trading-day forward distribution using historical daily return characteristics as the calibration base. The median simulated terminal price is 252.47, with a 5th to 95th percentile range of 202.26 to 340.74. The output is scenario-oriented and should be read as a range-based planning view.

05

DEFINITIONS & NOTES

Methodology

DATA SOURCE NOTES

Historical prices and asset metadata are sourced from the
local database, which is populated through the project ingestion layer using yfinance as the initial provider.

METHODOLOGY NOTES

Return metrics use simple daily returns. Volatility is annualized using a 252-trading-day convention. Historical VaR and Expected Shortfall are computed from the empirical daily return distribution.

SIMULATION ASSUMPTIONS

Monte Carlo price paths use a GBM-style process calibrated from historical daily drift and volatility. Simulation outputs are scenario-oriented and should not be interpreted as forecasts with certainty.

CAVEATS

The report is intended for analytical review and decision
support. It does not constitute investment advice, valuation certainty, or a substitute for independent diligence.
