02 HISTORICAL PERFORMANCE

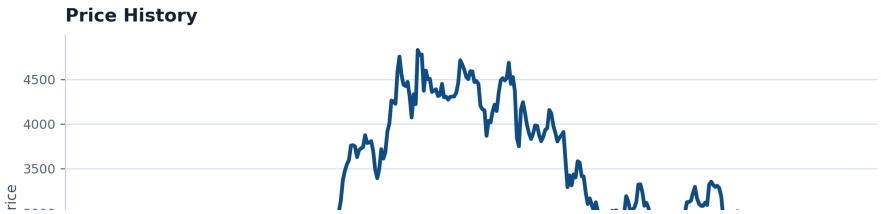
Performance Analysis

PERFORMANCE COMMENTARY

Historical performance over the stored
period was positive, with total return of 4.04% and annualized return of 2.77%. The price and cumulative return panels below are intended to show both absolute path behavior an...

TOTAL RETURN
4.04%

ANNUALIZED RETURN
2.77%



Price history provides path context while cumulative return shows compounding through time. The paired exhibits are positioned to support a memo-style performance read rather than a full-page chart dump.

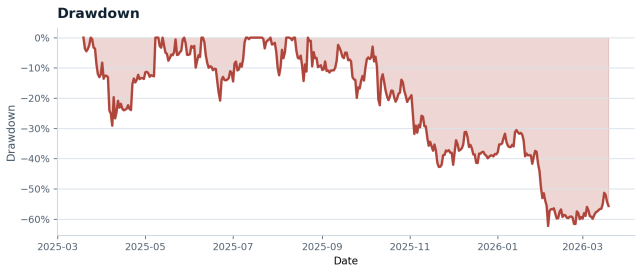
HISTORICAL DOWNSIDE REVIEW

Risk Analysis

ANNUALIZED VOLATILITY	MAX DRAWDOWN	HISTORICAL VAR	EXPECTED SHORTFALL
62.56%	**-62.29%**	**5.57%**	**8.11%**



RISK COMMENTARY

Realized annualized volatility was 62.56%, with maximum drawdown reaching -62.29%. Historical one-day downside measures include 95% VaR of 5.57% and Expected Shortfall of 8.11%. These metrics are intended as practical historical risk indicators rather than forward guarantees.

04

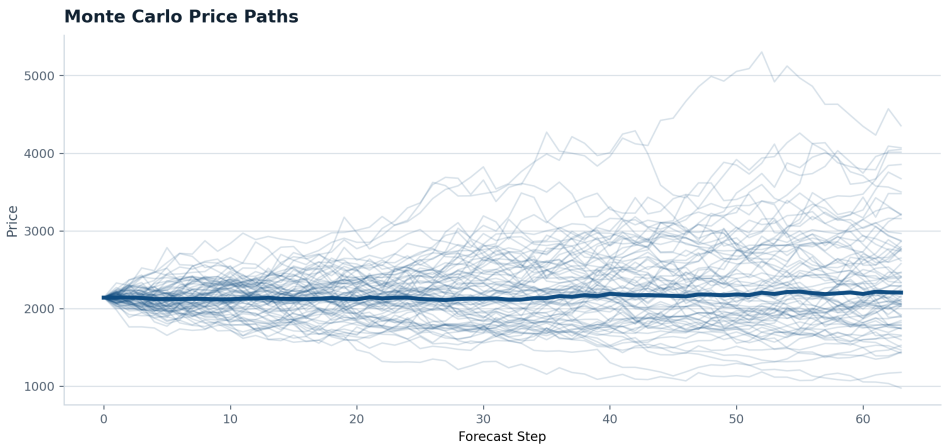
FORWARD SCENARIO ANALYSIS

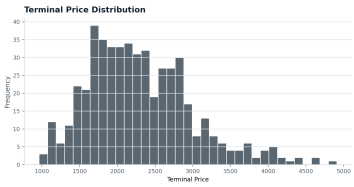
Simulation Outlook

FORECAST HORIZON	SIMULATION COUNT	ESTIMATED DAILY DRIFT	ANN. VOLATILITY
63 trading days	500	0.09%	62.56%

MEDIAN TERMINAL PRICE	PROBABILITY ABOVE START
2,205.91	55.20%

5TH PERCENTILE	95TH PERCENTILE
1,346.21	3,664.91





TERMINAL PERCENTILE SUMMARY

5TH PERCENTILE	1,346.21
25TH PERCENTILE	1,788.76
MEDIAN	2,205.91
75TH PERCENTILE	2,715.91
95TH PERCENTILE	3,664.91

SCENARIO COMMENTARY

Monte Carlo simulation projects a 63-trading-day forward distribution using historical daily return characteristics as the input estimate. The median simulated terminal price is 2,205.91, with a 5th to 95th percentile range of 1,346.21 to 3,664.91. This forward view is scenario-oriented...

05

DEFINITIONS & NOTES

Methodology

DATA SOURCE NOTES

Historical prices and asset metadata are sourced from the
local database, which is populated through the project ingestion layer using yfinance as the initial provider.

METHODOLOGY NOTES

Return metrics use simple daily returns. Volatility is annualized using a 252-trading-day convention. Historical VaR and Expected Shortfall are computed from the empirical daily return distribution.

SIMULATION ASSUMPTIONS

Monte Carlo price paths use a GBM-style process calibrated from historical daily drift and volatility. Simulation outputs are scenario-oriented and should not be interpreted as forecasts with certainty.

CAVEATS

The report is intended for analytical review and decision
support. It does not constitute investment advice, valuation certainty, or a substitute for independent diligence.
